

SAARTHI

ANNUAL REPORT / 2026 SAMPLE EDITION

The India Real Estate Perspective

A family office lens on markets, land and long-term ownership.

ILLUSTRATIVE SAMPLE / EDITORIAL FRAMEWORK

Created for the SAARTHI platform demonstration. Not an official publication, market outlook or investment recommendation.

A connected view of real estate

The purpose

This demonstration edition sets out an editorial framework for an annual SAARTHI research publication. It connects market context, infrastructure, development and ownership through the questions a family office may wish to investigate.

The reading route

Begin with the market and catchment, then examine infrastructure and the parcel. Consider the execution record and finally bring the asset back into the context of the family portfolio.

The scope

The following chapters contain research questions and evidence requirements. They do not contain observed market statistics, forecasts, ratings or investment recommendations. Publication data and conclusions must be supplied by the research team.

Look beneath the city average

Define the comparison

Set the geographic boundary, asset category, price segment and observation period before making a comparison. A useful research brief would explain which transactions and projects were included, and which were excluded.

Separate the evidence

Distinguish asking prices from completed transactions; new launches from unsold stock; contracted rent from advertised rent. Record the source, date, unit and coverage of every series.

Questions for the desk

Where is demand being observed? Which stock is competing for the same buyer or occupier? What could explain an apparent change in pricing or absorption? A published chapter should identify the evidence supporting each answer.

From a line on a map to a usable connection

Follow the milestone

A corridor brief should distinguish announcement, approval, construction and operation. Each milestone needs a dated source and a clear account of what is confirmed and what remains uncertain.

Study the catchment

Map the actual access route, interchange and last-mile connection. Ask which locations gain useful connectivity and which remain constrained by distance, access or incomplete supporting infrastructure.

Keep alternatives visible

Use separate scenarios for planned completion, delay and partial opening. Treat the map as a research aid; geographic precision, boundaries and project status require verification before publication.

Read the parcel before the potential

Build the parcel record

A parcel research file can assemble survey references, boundaries, access, surrounding uses and available ownership documents. Mark missing records and conflicting descriptions explicitly.

Separate potential from permission

A concept for development is different from a verified entitlement. The final report should record the applicable planning sources, their dates and the specialist review required for the specific parcel.

Frame the next question

What use is being contemplated? What access, services and approvals would that use require? Which uncertainties need to be resolved before an owner can compare development or monetisation alternatives?

A record beyond the launch

Define a comparable record

An execution review should identify the relevant projects, the role performed by the entity under review and the period examined. Do not treat a brand name as a substitute for entity-level evidence.

Organise the evidence

Possible research inputs include delivery milestones, disclosed financial information, project obligations and pipeline disclosures. A published assessment should separate verified records, management statements and unverified information.

Make gaps explicit

What remains unavailable? Which conclusions depend on assumptions? State the limits of the review and the evidence that would be needed to resolve the outstanding questions.

Bring the asset back to the family

Establish the inventory

Create a consistent record of locations, ownership interests, uses, counterparties and available valuations. Record valuation dates and methods rather than presenting unlike estimates as directly comparable.

Ask about dependencies

Which holdings share a tenant, developer, geography or source of demand? What information is needed to understand these dependencies? An analytical view should make unknown exposures visible.

Close with a research agenda

Set out questions for further work, the evidence owner for each question and the next review date. This sample provides an editorial structure only; it is not an assessment of any family portfolio.
